Bridget Crampton

(206) 308-3487 | crampton.b@northeastern.edu | Boston, MA | github.com/crbridget | linkedin.com/in/bridget-crampton

Education

Northeastern University, Khoury College of Computer Sciences — Boston, MA
Candidate for Bachelor of Science in Data Science; GPA: 3.69 — *May 2028*

- Relevant Coursework: Algorithms, Machine Learning, Statistics, Data Science, Advanced Programming with Data, Linear Algebra, Calculus, Probability Theory, Database Systems, Data Visualization, Financial Accounting and Reporting

Experience

Business Intelligence / Strategic Analytics Co-op — *July 2026 – Present*
Klaviyo — *Boston, MA*

- Modernizing competitor pricing intelligence across 9 competitors by building an **Airflow**-orchestrated **ETL pipeline** (**Python** → **AWS S3** → **dbt** → **Streamlit**), replacing an estimated 10 hours/week of manual chart updates with real-time dashboards and Slack price-change alerts that give the team a current view of market pricing
- Delivered ad hoc analytics in **SQL** and **Snowflake** for nontechnical stakeholders, including a data model segmenting growth metrics by platform to help evaluate the economics of a proposed incentive for driving adoption of a new AI product
- Building an **LLM-assisted data extraction workflow** (**OpenAI API**, **Workato**, **Snowflake**) that turns negotiated competitor quote PDFs into validated, source-traceable pricing data, capturing real-world discounted pricing that public list prices miss and supporting competitive pricing decisions
- Designing algorithmic deal-scoring models for 370+ monthly deals that combine quantitative, commercial, and qualitative Salesforce data into 0–100 scores, giving Deal Desk a consistent, data-driven read on deal risk

Data Engineer — *Aug 2026 – Present*
Remetra, Generate Product Development Studio — *Boston, MA*

- Designing a **Bayesian** symptom-trigger model for an autoimmune health app, replacing a **Fisher's exact test** prototype with exact posterior inference over **38,500+ trigger hypotheses** from time-binned food and symptom logs
- Building a **synthetic-user simulator** with planted triggers and realistic logging noise to benchmark an adaptive **information-gain** recipe policy against random and elimination-diet baselines
- Developed **FastAPI/Python** endpoints, including a meal follow-up notification service (**90%** test coverage) and an idempotent Apple Health sync using **PostgreSQL upserts**

Data Analyst Intern — *March 2026 – June 2026*
IDX Exchange — *Remote*

- Engineered a Python data pipeline pulling 12 months of live real estate transaction data from an API, cleaning it and calculating market metrics with statistical outlier detection to surface trends and anomalies
- Used that data to build 6 interactive **Tableau** dashboards covering market trends and top-100 agent/brokerage rankings with zip code heat maps, filterable by geography and property type; presented findings in a final market intelligence report

Projects

Internship Tracker | *Python, Flask, React, PostgreSQL/Supabase* — *Aug 2026 – Present*

- Assembled an automated pipeline (Python, cron) that polls 50+ companies' Greenhouse/Lever job boards and diffs postings against a **PostgreSQL**/Supabase schema to detect new, updated, and closed roles, then ranks them by relevance to the user using text embeddings (**Sentence-Transformers**, cosine similarity)
- Constructed a web app (Flask backend, React frontend) that lets users add companies to track on the fly, specify target roles, and view personalized, ranked matches update in real time

Credit Card Fraud Detection: Comparative ML Study | *Python, Scikit-Learn, XGBoost* — *Spring 2026*

- Trained and compared 6 models (including **XGBoost** and a **neural network**) to detect fraudulent credit card transactions across 590k+ transactions, with the best model (XGBoost) correctly flagging fraud with 0.9075 AUC
- Combined the top-performing models into a single ensemble system, more than doubling fraud-catching precision (0.67 vs. 0.26) compared to using the best individual model alone

Technical Skills

Languages & Frameworks: Python, SQL, JavaScript/TypeScript, HTML/CSS, React, FastAPI, Flask
ML/Data Science: Scikit-Learn, XGBoost, TensorFlow/Keras, NumPy, Pandas, SciPy, NLTK, NetworkX
Databases & Tools: PostgreSQL, Snowflake, dbt, Apache Airflow, AWS S3, Docker, Selenium, Git/GitHub
Visualization: Tableau, Streamlit, Excel/Google Sheets, Matplotlib, Seaborn, Plotly, Altair, D3.js

Leadership & Campus Involvement

Software Engineer — *Jan 2026 – May 2026*
Forge, Northeastern University — *Boston, MA*

- Created a TypeScript parser (Tree-sitter) that extracts 10+ code metrics per file and renders codebases as 3D "cities" of buildings, gamifying personal projects to keep developers motivated

Founder, Co-President of Outreach — *Jan 2025 – May 2025*
Girls Who Code Chapter, Northeastern University — *London, UK*

- Grew chapter 5x from 4 to 50+ members; organized semester-long speaker series spanning agritech, data visualization, and space exploration for 90+ attendees
